Filtrando os dados espúrios

Encontrar Outliers

A filtragem dos dados espúrios funciona pelo princípio de quartis , onde se aplicam as seguintes equações e assim descobre-se os pontos a serem descartados:

```
Lim_{min} = Q_1 - 1.5(Q_3 - Q_1)
Lim_{m\'ax} = Q_3 + 1.5(Q_3 - Q_1)
 ([15.1], [16])

    begin

        outliers = []
valoresd1 = []
indexd1 = []
        Q = quantile(d1)
        Q1 = Q[2]

Q3 = Q[4]
        out_min = Q1-1.5*(Q3-Q1)
        out_max = Q3+1.5*(Q3 -Q1)
        for i in d1
            if i < out_min</pre>
                 append!(valoresd1,i)
            elseif i > out_max
                 append!(valoresd1,i)
            end
        end
        for i in 1:49
            for j in valoresd1
                 if j == d1[i]
                      append!(indexd1, i)
                 end
            end
        end
        for i in indexd1
            append!(outliers,x[i])
        outliers, indexd1
 end
```

Filtrar Outliers

```
    begin

     xx = convert(Array{Float64}, [])
     yy = convert(Array{Float64}, [])
     oxx = convert(Array{Float64}, [])
     for i in 1:49
          for j in outliers
              if x[i] != j
                  append!(xx, x[i])
                  append!(yy, y[i])
                  append!(oxx, ox[i])
              end
          end
     end
     if size(outliers,1) == 0
          Print(size(outliers,1)," ponto foi removido!")
     elseif size(outliers,1) == 1
          Print(size(outliers,1)," ponto foi removido!")
